TenderLens

Find the tender worth your time.

Evidence-linked bid readiness and amendment tracking for small suppliers.

HackIIITD 2026 • Round 1 • Idea proposal

Next.js interface | TinyFish-powered discovery | Planned AWS deployment

A relevant tender can still be the wrong tender

Search notices → Open multiple PDFs → Check eligibility → Recheck amendments

Why this goes wrong

Eligibility is fragmented: turnover, experience, certificates, deposit and deadlines live in different clauses.

Product relevance does not establish eligibility.

A later corrigendum can change the deadline or a required condition.

Primary user

A small lab-equipment supplier selling to colleges, with a lean team and no dedicated bid analyst

Secondary user

Local electronics and IT suppliers

Real source pattern: **IIIT-Delhi publishes tender documents, corrigenda and revised closing dates. [1]**

One profile. A traceable decision. Every change visible.

1

Supplier profile

categories, turnover period, past work, certificates

2

Discover notices

TinyFish browses selected public pages

3

Extract evidence

PDF clause + page + source

4

Compare conditions

deterministic rules

5

Review shortlist

- Meets
- Blocked
- Review needed

Refresh → compare document versions → flag changed conditions

Every status opens the supporting clause.
Every change shows before → after.

Human remains responsible for deciding whether to bid.
No auto-submission.

A wireframe for the complete review journey

Editable Figma concept • synthetic sample data • profile → shortlist → evidence → changes

01 / Supplier profile

Enter capabilities and supporting evidence.

Categories: Lab equipment, electronics

3-year average turnover: ₹35 lakh

Manufacturer authorisation: missing

Save profile → Find relevant notices

02 / Tender shortlist

Product relevance is separate from readiness.

Tender A: BLOCKED • turnover too low

Tender B: REVIEW NEEDED • certificate missing

Tender C: MEETS checked conditions

Choose a notice → Inspect its conditions

03 / Clause evidence

Every outcome opens the exact source clause.

Required turnover: ≥ ₹50 lakh / 3 years

Supplier: ₹35 lakh / same period

BLOCKED • sample clause 3.2 • page 4

Compare condition → See the reason

04 / Amendment history

Show what changed and what remains unresolved.

Closing date: 18 Oct → 22 Oct

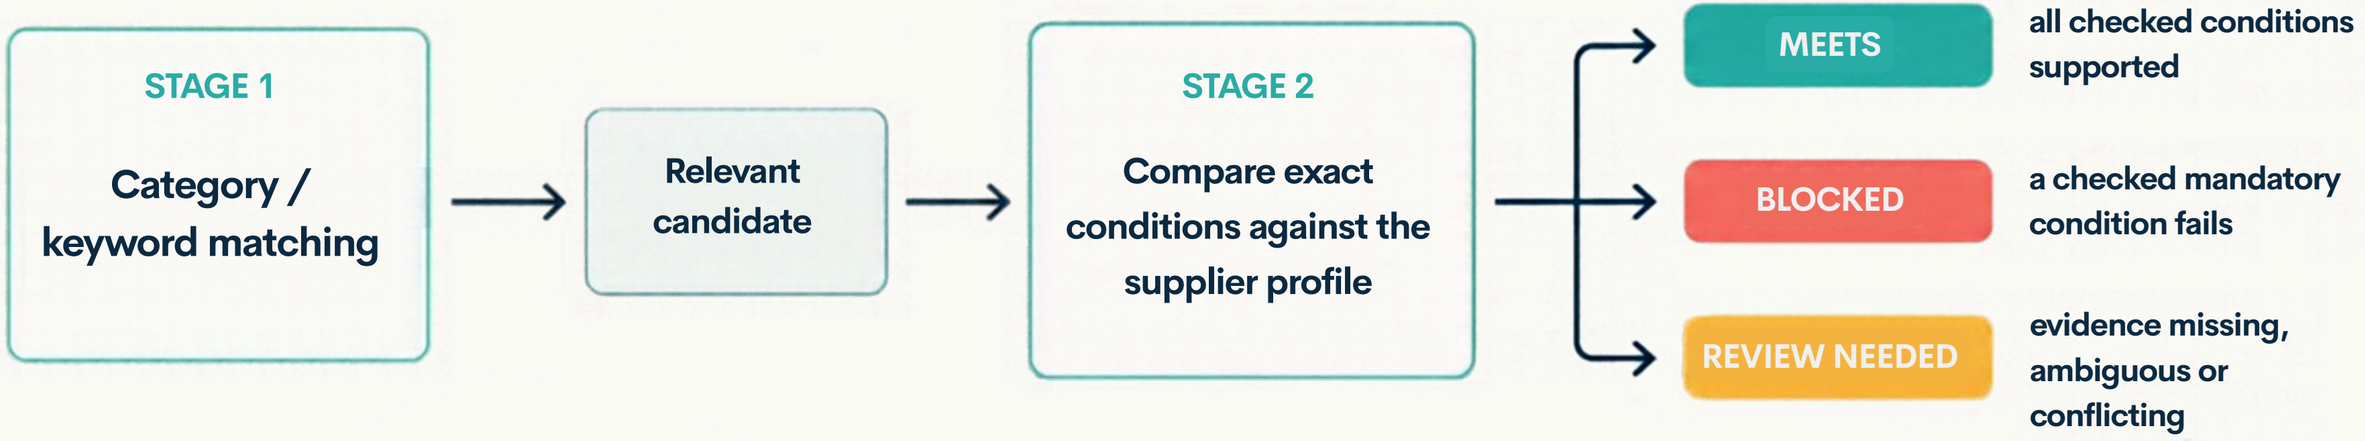

Evidence: sample corrigendum 01 • page 1

Turnover and certificate blockers remain

Re-review amended conditions before bidding

Open editable Figma wireframe ↗

Discovery ranks relevance. Rules check readiness.

Turnover | Experience | Certificates | Deposit | Deadline

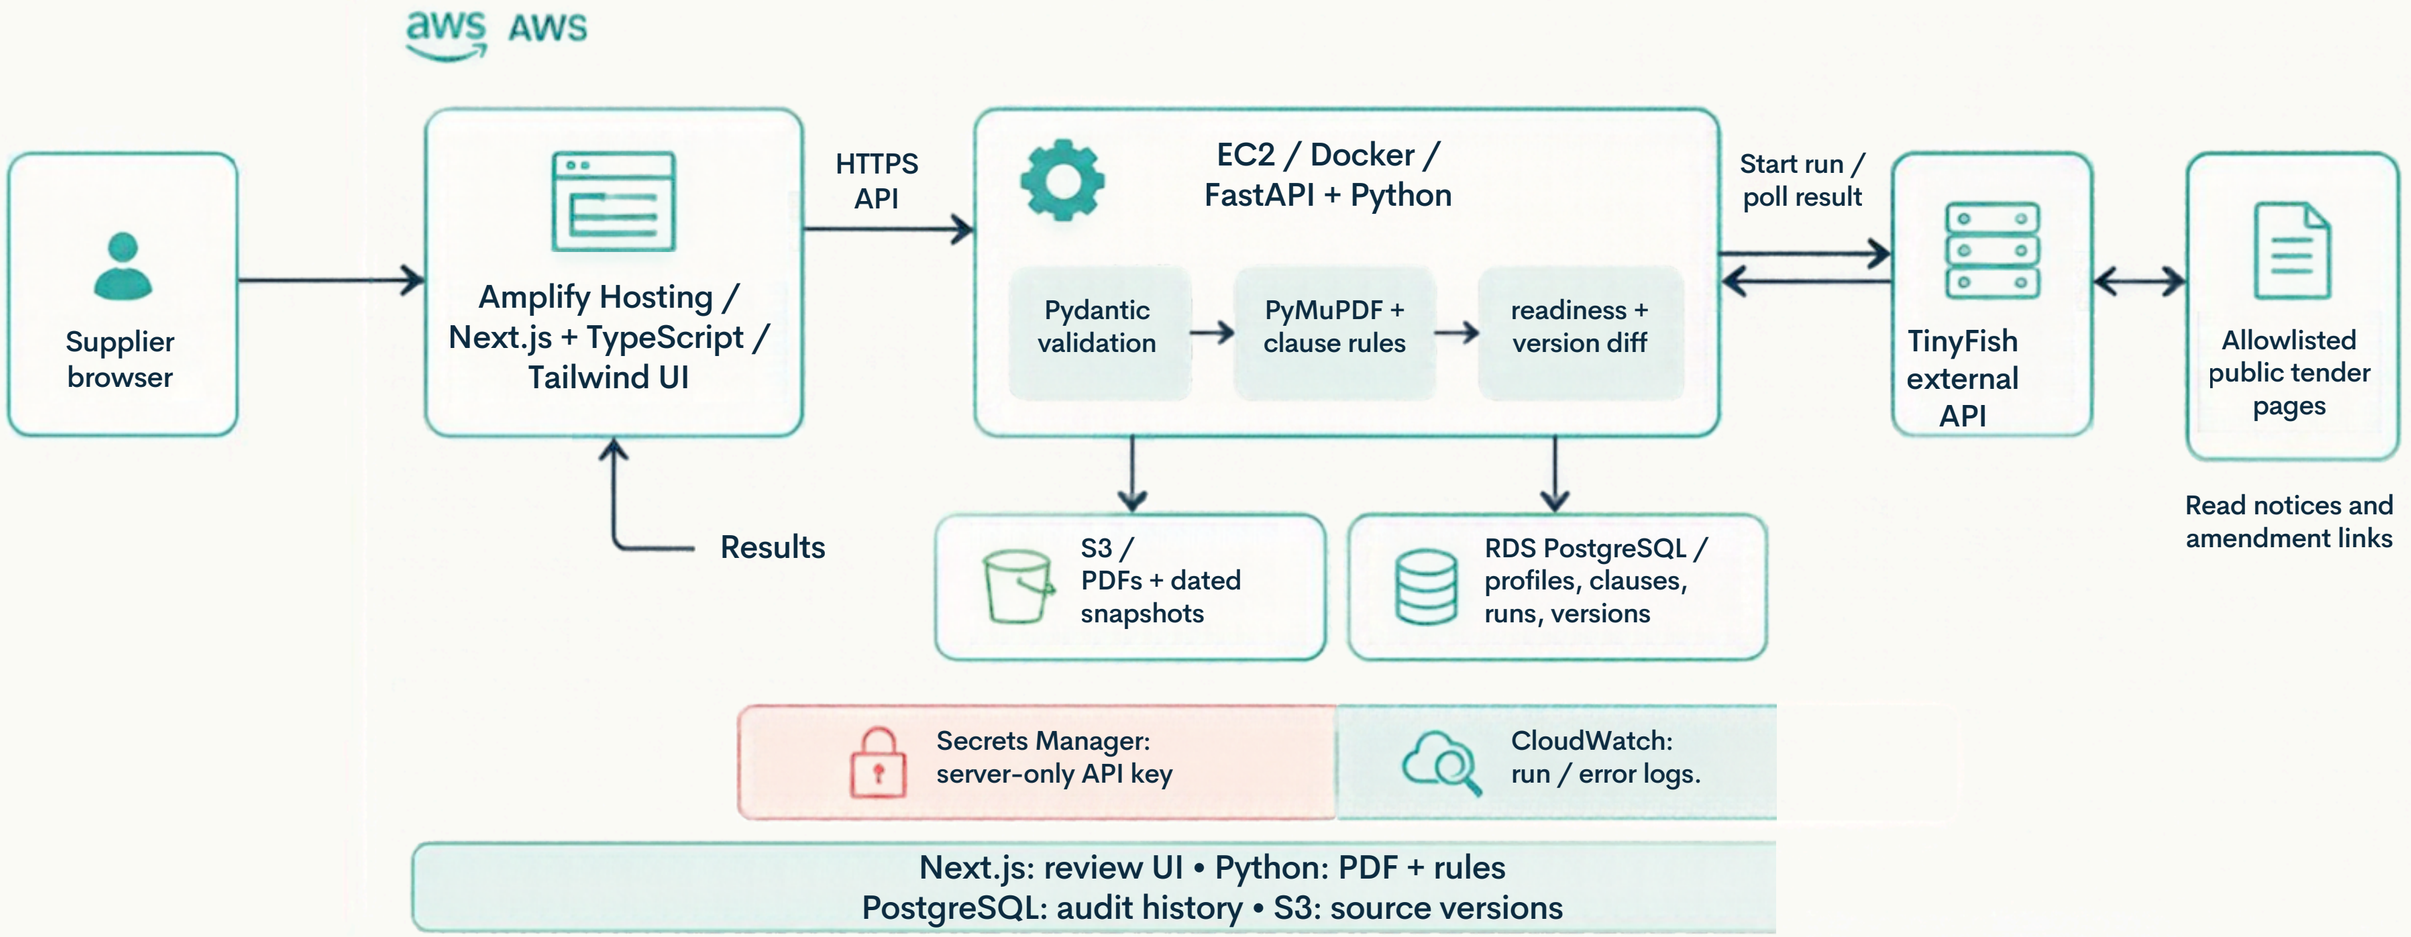

Compare the same period and units. Never turn a missing value into a pass.
Complex exceptions stay for human review.

Mehrbod et al. (2018) studied semantic tender-product matching.

We build on the discovery idea with clause-level evidence, deterministic checks and amendment history. [2]

Research informs the design; product performance is not yet validated.

Planned AWS architecture

Proposed deployment for the finale; no application has been deployed. [4]

TinyFish is the evidence collection layer

START SOURCE

https://iiitd.ac.in/tenders

API CALL FLOW

POST /v1/automation/run-async
to TinyFish Agent API **(server-side X-API-Key)**

↓

GET /v1/runs/{run_id}

↓

Validate output

↓

Save evidence

↓

Re-evaluate

TASK TO TINYFISH

Find up to five lab/electronics notices.
Return ID, title, deadline text, PDF URLs
and every visible corrigendum link.
Preserve missing fields; do not infer eligibility.

OUTPUT SCHEMA

Object containing

notices[ID title deadline text
source URL PDF links amendment links]

BACKEND ENRICHES AND EXTRACTS

Adds retrieved_at, run_id and
document hash.
Retrieves allowed PDFs;
extracts page-level clauses.

FAILURE HANDLING

Only completed, validated runs update results.

Missing or conflicting data → Review needed.

Timeout/ rate limit → bounded retry + labelled cached snapshot.

KEY DIFFERENTIATOR

TinyFish navigates changing pages;
TenderLens owns eligibility logic and change history. [3]

Public, read-only sources; no CAPTCHA dependency.
Live API access and quota will be checked
at the start of the finale.

A focused MVP, built by four people in 24 hours

0–3h	3–10h	10–16h	16–21h	21–24h
Source access + real TinyFish run	Extraction, rules and UI	Connect evidence + version history	Labelled tests + failure cases	AWS deployment + demo rehearsal

PROPOSED OWNERSHIP	Sameer Gupta (Lead)	Trisha	Tripti	Sunil
	TinyFish + AWS	Next.js + UI	rules + data	validation + demo

SCOPE

1 source
10 reviewed notices
5 condition types
1 amendment comparison

MAIN RISK / CONTROL

Unreadable PDF or ambiguous exception → preserve Review needed; clearly labelled manual upload fallback.

BOUNDARY

Deferred: OCR, automatic bidding, universal portal coverage.

SCALE

Fetch once per source; cache by notice ID + hash; recheck only changed conditions. Later: SQS workers and additional reviewed sources.

Less wasted review.
More defensible decisions.

Know what fits, what blocks you, and what changed.

Expected impact

Faster triage

Visible blockers

Fewer overlooked amendments

Finale acceptance targets — not results

≥90% exact field extraction on 10 manually labelled notices

100% of reported conditions linked to source + page

0 missing-evidence cases silently marked Meets

Log missed / false amendment alerts and refresh latency; compare review time with a manual baseline.
